CD-Feed

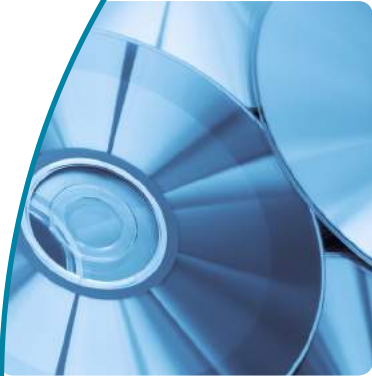

Simplify your Dicom CD imports

CD-Feed is a solution to copy, reconcile, distribute and store outpatient imaging exams (DICOM) from a CD.

Functions

How CD-Feed improves your workflow?

- Zero interaction: the CD is read and ejected without interaction. Ideal for secretaries, doctors or patients!
- The exams are stored in a DICOM buffer. The integration of selected exams with a PACS is performed asynchronously by an administrator.
- Instant streaming of exams from the buffer with the product companion, **Anywhere**.
- No manual creation of a worklist in advance: CD-Feed plugs into the HL7 flow of admissions
- Full traceability of users and exams that are imported, reconciled and stored in the PACS (patient identity integrity).
- Scoring for reconciliation: automatic search in the HIS for the nearest demographic data.

Simple
